Upgrading the ICT Regulatory Framework:
Toward Accelerated and Inclusive Digital Connectivity

Ramonette B. Serafica
Queen Cel A. Oren

PHILIPPINE INSTITUTE FOR DEVELOPMENT STUDIES

September 2022

Abstract

Across different metrics, the ICT performance of the Philippines remains subpar compared to ASEAN members and other countries at the same level of development. The quality of the country's ICT regulatory environment, composed of regulatory authority, regulatory mandate, regulatory regime, and competition model, is significantly below what is considered international best practice, consequently impeding the use of various technological solutions available to bridge the gap in digital inequality. Although significant policy changes have recently been introduced, more reforms are needed to achieve inclusive and accelerated digital connectivity. Priorities include reforming the licensing regime, formulating a spectrum policy and plan, and reinventing the NTC to ensure regulatory independence.

Keywords: ICT, telecommunications, digital, regulation, broadband

Upgrading the ICT Regulatory Framework: Toward Accelerated and Inclusive Digital Connectivity

*Ramonette B. Serafica and Queen Cel A. Oren**

1 Introduction

1.1 Background

Only 17.7 percent of households in the Philippines have internet access at home. This is significantly below the average of 61.5 percent globally and 52.6 percent for developing countries in 2019 (ITU 2021b). Internet access is also highly uneven across the Philippines. The National Capital Region has the highest proportion of connected households with 33.2 percent, while the BARMM has the lowest with only 4.5 percent (DICT 2019).

The Philippine Development Plan 2017-2022 identified a number of reforms needed to improve ICT infrastructure and ensure accessible, affordable, and reliable services. These include strengthening the roles of the Department of Information and Communications Technology (DICT) and the National Telecommunications Commission (NTC) in order to promote competition and innovation in light of technological advancements, changing market landscape, and convergence of technologies (NEDA 2017). The legislative agenda also covered pursuing an open access policy that is non-discriminatory for all telecommunications market segments and fostering effective competition by publishing prices for the broadband and telecom market.

The National Broadband Plan (DICT 2017), which lays out the necessary interventions to provide affordable and fast internet to digitally connect the country, likewise highlighted the need to amend or revise relevant policies and regulations to accelerate investment in the broadband market. These include the Commonwealth Act No. 146 (Public Service Act), Republic Act 7925 (Public Telecommunications Policy Act), Republic Act 3846 (Radio Control Law), as well as Article XII, Section 11 of the 1987 Constitution. Additionally, the Plan identified proposed legislations relevant to the ICT sector, including the Open Access and Peering Policy to address interconnection issues and facilitate faster internet connection and the establishment of a Universal Access and Service Fund (UASF) to benefit the countryside.

A couple of the reforms proposed in the national and sectoral plans were adopted recently. Last December, access to satellite services was liberalized, enabling direct access to all satellite systems to provide internet services. In March of this year, the Public Service Act amendment was passed, removing foreign equity limitations in key sectors. The amendment of the Public Service Act (RA 11659) is expected to be a catalyst for improving the quality and availability of infrastructure services that have been declassified as public utilities, such as telecommunications and transport services (except public utility vehicles).

While these reforms are significant, more changes in the regulatory environment are needed to achieve widespread connectivity in the Philippines.

* Senior Research Fellow and Research Specialist, respectively, at the Philippine Institute for Development Studies. The authors are grateful to Hon. Edgardo V. Cabarios (NTC), Atty. Oliver Xavier Reyes (Disini Buted Disini Law), Mr. Pierre Tito Galla (Democracy.Net.PH), and Dr. Franz A. de Leon (DOST-ASTI) for sharing invaluable information and insights. The administrative and research assistance of Ms. Junalyn Bayona is likewise acknowledged.

The views expressed in this paper are those of the authors and do not necessarily reflect the position or official policy of any company or any agency of the Philippine government. The authors are solely responsible for the analysis and conclusions in this paper including any errors.

1.2 Objectives

1.2.1 General Objective

The main objective of the paper is to update the structure and elements of the regulatory environment for ICT, including the regulatory authority.

1.2.2 Specific Objectives

- i. Survey best practice regulatory frameworks or approaches.
- ii. Examine the gaps and/or weaknesses in the Philippine regulatory environment, including the regulatory authority.
- iii. Provide specific recommendations such as changes to existing laws or propose new regulations to improve the regulatory framework for telecommunications and related sectors, if needed. Areas for further research will also be recommended.

1.3 Methodology

Primary and secondary data were gathered through desk reviews and key informant interviews (KIIs) with the telecom regulator (NTC), government research institute (DOST-ASTI), a legal specialist, and an ICT advocate. For data analysis, the project compared Philippine regulations and practices with regulatory trackers and benchmarks from the International Telecommunication Union (ITU) and World Bank and other ICT-related data. Recommendations for policy and further research were based on gap analysis and insights from KIIs.

1.4 Organization and scope

The next chapter presents key indicators of ICT performance and compares the Philippines with countries at the same level of development and with ASEAN members. The rationale for the regulation of the ICT sector is discussed in Chapter 3, which looks at technological developments and the evolution of regulatory models. Chapter 4 reviews the Philippine regulatory environment. It first presents the key elements of the regulatory framework and identifies the gaps and weaknesses compared to international best practices. The key structural issues are then discussed, focusing on the regulator and the barriers to entry. The paper concludes with a summary of the key findings and recommendations.

2 Overview of the Philippine ICT performance

Minges (2015) reviewed studies on the association between broadband penetration and economic growth in developed and developing countries. For instance, World Bank studies in 2009 reported that an increase of 10 percentage points in fixed broadband penetration would result in GDP growth of 1.38 percent in developing countries at a 10 percent significance level. Another research adopting the same methodology used 1980 to 2011 data from 86 countries and found that an increase in fixed broadband of ten percentage points led to a 1.35 percent increase in per capita GDP for developing economies. In the case of the Philippines, a ten-percentage point increase in mobile broadband penetration accounts for 0.32 percent of GDP using data from 2000 to 2010.

Broadband is high-speed access to the internet, which is always-on and capable of multiple service provisions simultaneously. Entry-level broadband is defined by the National Telecommunications Commission (NTC) as having an internet speed of at least 256 Kilobits per second (Kbps). The International Telecommunication Union-Telecommunications Standardization Sector (ITU-T n.d.) defines broadband as having a transmission speed of at

least 1.5 or 2.0 Megabits per second (Mbps). Under the National Broadband Plan, an entry-level broadband internet connection must have a minimum speed of 2.0 Mbps (DICT 2017).

Mobile broadband users benefit from its portability and mobility features. It is not limited to fixed-line nor short-range coverage for Wi-Fi access connected to fixed broadband. Due to fixed broadband costs, internet users in developing countries tend to substitute mobile broadband with fixed broadband since it is cheaper when prices are compared for a minimum threshold speed and capacity. An infrastructure providing fixed-broadband access may not always be available for developing countries. The high cost of fixed broadbands may be due to the need for fixed broadband providers to allot large investments for building fixed-line networks. In addition, a variety of applications is available on mobile phones, such as personal banking, medical information, communication via email, and social networking sites. Among these, social media is the most important activity for those who rely on a mobile broadband connection (McDonough 2012).

Despite the features of mobile broadband, its internet speed is significantly slower than fixed broadband. The limited availability of radio frequency spectrum also restrains the performance of mobile broadband. Fixed broadband is faster than mobile broadband since the information path can be assigned to a single customer. Customers with Fiber and cable lines may also have the option to increase their speed, consequently increasing costs. When the price is measured by Mbps, mobile broadband is more expensive than fixed broadband. Increased usage of data-intensive activities, such as video streaming, video-related applications, and cloud computing, require higher speeds and bandwidth, which mobile broadband lacks. Moreover, a mobile subscription includes a limited monthly traffic allowance, making them less reliable than fixed broadband with no limit in traffic data allowances (McDonough 2012; Quaglione et al. 2020).

Apart from bandwidth and speed issues of mobile broadband, some devices at home may be incompatible with or cannot be sufficiently supported by a mobile broadband connection, such as desktop computers and smart TVs. These devices are more suited to using fixed broadband connections. Mobile broadband is less suitable for other activities like learning and job seeking. Data caps and small screens are not as conducive for learning activities, such as attending meetings, conferences, conventions, and online courses. Users relying on mobile broadband connections resort to alternative ways to complete learning tasks, such as using Wi-Fi in public libraries and computers. Jobseekers filling out job applications using mobile phones encounter difficulties viewing materials, reading content, and submitting documents. Some use mobile broadband to complement fixed broadband, especially in developed countries. For instance, one may access data such as documents, videos, and photos through mobile phones. However, processing data (e.g., editing pictures, writing letters, and preparing documents) is done using more powerful devices via computers using a fixed broadband connection (Quaglione et al. 2020; Anderson and Horrigan 2016).

2.1 ICT Prices

The International Telecommunication Union (ITU) developed five (5) ICT price baskets¹ to assess the affordability of ICT services in UN member states using the country's gross national income (GNI) per capita. ICT price baskets are updated regularly to adapt to the changing ICT market. The UN Broadband Commission for sustainable development set a target of below 2 percent of GNI per capita by 2025 as a goal of pursuing more accessible and affordable ICT services (ITU 2022). Figure 1 shows the five (5) ICT price baskets based on country groups in

¹ (1) Data only mobile-broadband basket (minimum monthly allowance: 2GB data), (2) Mobile data and voice low-consumption basket (minimum monthly allowance: 70 min voice, 20 SMS, 500 MB data), (3) Mobile data and voice high-consumption basket (minimum monthly allowance: 140 min voice, 70 SMS, 2 GB data), (4) Mobile-cellular low-usage basket (minimum monthly allowance: 70 voice, 20 SMS), (5) Fixed-broadband basket (minimum monthly allowance: 5 GB data).

2021. High-income countries have affordable ICT services across all ICT baskets, while upper-middle-income countries, on average, have affordable data-only mobile broadband and mobile cellular basket-low usage baskets. Both low and lower-middle-income countries, including the Philippines, fall short of the target goal of 2 percent GNI per capita across all ICT baskets.

Figure 1. ICT price baskets in terms of percent (%) of monthly GNI per capita, by income groups and Philippines, 2021.

Note: for country groups, medians were used, which were only calculated for the subset of economies with data available.

Source: ITU (2021a)

The fixed broadband basket for the Philippines decreased from 2011 to 2018 and was steady from 2018 to 2019. However, it increased from 2019 to 2021 from 4.16 to 11.56 percent, which may be attributed to the COVID-19 pandemic. The most affordable ICT price basket in the Philippines is Data-only mobile broadband. Its price was below the 2 percent GNI per capita target in 2020, while the Fixed-broadband basket is the most expensive ICT basket, with an 11.56 percent share of GNI per capita. See Figure 2.

Figure 2. Philippine ICT price baskets in terms of share (%) of monthly GNI per capita, in comparison with the affordability target of 2 percent by the UN Broadband Commission for sustainable development, 2008-2021.

Source: ITU (2021a)

Figure 3 shows the comparison of Philippine ICT price baskets with the ASEAN neighboring countries. In 2021, Myanmar and Cambodia had the most expensive Fixed broadband, while Laos and Cambodia had the most expensive ICT services in the remaining ICT price baskets. The Philippines is the 3rd most expensive ICT service across all the ICT price baskets among the ASEAN member states. Note that Laos, Cambodia, Myanmar, and the Philippines are lower-middle-income countries. Additionally, Singapore and Brunei Darussalam consistently have the most affordable ICT services among the ASEAN countries across all ICT price baskets.

Figure 3. Philippine ICT price baskets, in comparison with other ASEAN countries (% share of monthly GNI per capita)

2.2 Availability

In terms of the population covered by mobile networks worldwide, Figure 4 shows the gap between the rural and urban areas. Urban areas are completely covered by a mobile-cellular network (100 and 96 percent are covered by the 3G and LTE/WiMAX mobile network, respectively). In contrast, about 93 percent of the rural population is covered by a mobile-cellular network. About 88 percent of the rural population are covered by 3G, and 74 percent are covered by the LTE/WiMAX mobile network.

Figure 4. Population covered by a mobile cellular, 3G, and LTE/WiMAX mobile network in developing countries, urban-rural area, 2021

Source: ITU (2021b)

Regarding development status, as of 2019, 98.6 percent of the population in developed countries is covered by a mobile cellular network, while 92.5 percent are covered in developing countries. About 93 percent of the population in the developing countries are covered by both 3G and LTE/WiMAX mobile networks, while 88 and 73.8 percent are covered in the developing countries. See Figure 5.

Figure 5. Population covered by a mobile cellular, 3G, and LTE/WiMax mobile network, by development status, 2021.

Source: ITU (2021b)

In the Philippines, 94 percent of the population is covered by at least a 4G mobile network as of 2019 (Table 1), while it is ranked third among the countries with the lowest international bandwidth,² as shown in Figure 6. Singapore excels in terms of population covered by at least 4G mobile network and international bandwidth (See also Figure 7 for the international bandwidth per internet user (bit/s) in ASEAN countries, except Singapore).

² International bandwidth refers to “the total used capacity of international bandwidth; in megabits per second (Mbit/s). It is measured as the sum of used capacity of all Internet exchanges (locations where Internet traffic is exchanged) offering international bandwidth. If capacity is asymmetric (i.e., more incoming (downlink) than outgoing (uplink) capacity); then the incoming (downlink) capacity should be provided” (World Bank 2022). International Internet bandwidth (bit/s) per Internet user is calculated by converting to bits per second and dividing by the total number of Internet users.

Table 1. Proportion of population covered by at least a 4G mobile network (%), ASEAN countries

Country	2017	2018	2019
Singapore	100	100	100
Thailand	98	98	98
Viet Nam	95	93.89	97
Indonesia	90.42	97.59	97.59
Brunei Darussalam	90.04	94.94	95.25
Philippines	80	-	94*

ICT services subscriptions in ASEAN countries, such as Fixed-telephone, Fixed broadband, Mobile-cellular, and Mobile-broadband per 100 inhabitants from 2000 to 2020, are shown in Figure 8. In the Philippines, Fixed telephone subscriptions peaked in 2010 and declined in the subsequent years. Mobile cellular and mobile broadband subscriptions are increasing, except from 2019 to 2020. Finally, the number of fixed broadband subscriptions also shows an upward trend.

Figure 8. Subscriptions per 100 inhabitants in ASEAN countries, 2000-2020

Source: ITU (2021b)

As could be expected, the number of households with internet access in developed countries is higher than in developing countries, as shown in Figure 9. In 2020, only 58 percent of households in the developing country had internet access at home, compared to about 88 percent of households in developed countries.

Figure 9. Household with internet access at home (%), by development status, 2005-2020

Source: ITU (2021b)

More than fifty percent of the households in six (6) ASEAN countries have internet access at home. Respectively, 98.4 and 91.7 percent of the households in Singapore and Malaysia can access the internet at home. The Philippines falls behind seven (7) countries, with only 17.7 percent of its households with internet access at home (Table 2).

Table 2. Proportion of households with internet access in ASEAN countries

Country	Year	Percent (%)
Singapore	2020	98.4
Malaysia	2020	91.7
Thailand	2020	85.2
Indonesia	2020	78.2
Viet Nam	2020	76.4
Brunei Darussalam	2019	53.6

Philippines	2019	17.7
Lao P.D.R.	2017	1.7
Myanmar	-	-

Source: ITU (2021b)

Figure 10 shows the number of internet users in ASEAN countries from 2000 to 2020. The number of individuals using the internet has increased across all countries. Brunei Darussalam, Singapore, and Malaysia are the top three countries with the highest percentage of individuals using the internet. In 2020, the Philippines, along with Cambodia, Laos, and Myanmar, lags behind the other six (6) countries.

Figure 10. Percentage (%) of individuals using the internet in ASEAN countries, 2000-2020

Source: ITU (2021b)

In the 2019 National ICT Household Survey (NICTHS), on average, only 17.7 percent of households in the Philippines have internet access. Six (6) out of 17 regions are above the average number of households in the country that have internet access (Figure 11). These are regions I, II, III, IV-A, CAR³, and NCR⁴. These regions are found in the Luzon area (northern part of the Philippines). Regions IX, X, and BARMM, which have the least proportion of households with internet access, are found in the southern part of the Philippines (Mindanao).

Figure 11. Proportion of households with internet access by region, 2019

Note: NCR = National Capital Region; CAR = Cordillera Administrative Region; BARMM = Bangsamoro Autonomous Region in Muslim Mindanao

Source: DICT (2019)

³ Cordillera Administrative Region

⁴ National Capital Region

As the previous graph shows, only 4.5 percent of the households in the BARMM have access to the internet compared to 33.3 percent of the households in the NCR. As shown below, household internet access positively correlates with the gross regional domestic product (GRDP) per capita (Figure 12), while household internet access is negatively associated with poverty incidence (Figure 13).

Figure 12. Household internet access vs. GRDP per capita, by region, 2019

2.3 Speed

In the ASEAN countries, as of the data in March 2022, Only Singapore, Vietnam, and Thailand are above the global average mobile speed. Regarding fixed broadband, Singapore, Thailand, Malaysia, and Vietnam scored higher than the global average download speed of 62.52. The Philippines' median scores are 19.38 and 52.16 for mobile and fixed broadband, respectively. See Table 3.

Table 3. Median download speeds (Mbps) in ASEAN countries, as of March 2022

Country	Mobile	Fixed Broadband
Singapore	67.99	197.97
Thailand	33.49	187.80
Vietnam	33.90	67.96
Lao PDR	23.41	28.32
Malaysia	25.87	84.61
Myanmar	24.06	16.86
Cambodia	16.12	19.33
Philippines	19.38	52.16
Indonesia	17.70	21.23
Global average	29.96	62.52

Source: Ookla (2022a)

The National Broadband Plan (DICT 2017) cited the Akamai quarterly connectivity reports from the 1st quarter of 2015 to the 1st quarter of 2017 to show the internet speeds of the ASEAN-5 countries (See Figure 14). The average internet speed generally increases. Indonesia initially had the lowest internet speed among the ASEAN-5 countries. However, it has already outperformed the Philippines since the 3rd quarter of 2015.

Figure 14. Average connection speed (Mbps) in ASEAN-5 economies, 1st Quarter 2015 to 1st Quarter 2017

Note: The latest data available is only until the 1st Quarter of 2017.

Source: Akamai (2015-2017)

The fixed broadband internet speed in the Philippines has been increasing since December 2021. It jumped from the global ranking of 66 in May 2021 to 58 in May 2022. Its global ranking in terms of mobile internet speed moved up from 95 to 91 from April 2022 to May 2022. The mobile download speed gradually increased to 19.26 Mbps in May 2022 from 16.26 Mbps in May 2021. However, the performance of mobile upload speed is lagging, which has been consistently under 5 Mbps in the past 12 months (See Figure 15).

Figure 15. Philippines’ mobile and fixed broadband internet speeds (Mbps), May 2021 - May 2022

Source: Ookla (2022b)

3 The regulation of ICT

3.1 Technological changes and implications for regulation

According to WB, InfoDev, and ITU (2011), the transition to Next Generation Networks (NGN) and convergence are the two innovations that have had the most influence on the ICT sector. Various forms of convergence have shaped the telecommunications and ICT industries, which have implications for government policy and regulation (Figure 16). In general, convergence refers to the erosion of boundaries among previously separate networks, services, and business practices. According to Singh and Raja (2010), these include:

- **Service convergence or ‘multiple play’** - Multiple services traditionally provided by separate networks can now be offered by firms using one network. For instance, communication companies offer multiple services such as television, telephony, and internet services via cable, telephone, or wireless networks. In terms of benefits, service convergence enables service providers to expand into new markets, utilize existing networks more efficiently, offer discounted bundles, and enhance access to new ICT services. However, subscribers could become tied to a single provider. Smaller firms, particularly those that do not own network infrastructure, might not thrive in the market. *The implication for policy is that convergence changes the scope and boundaries of markets and alters entry barriers.*
- **Network Convergence** - Where a common standard enables the connection of different types of networks, allowing communication service to travel over multiple networks. Skype is an example of an internet telephony service that carry voice telephony via the Internet and traditional networks. The reduced costs result in lower tariffs, and network

integration allows user mobility and coverage expansion. However, it could lower investment in building networks. ***Connecting different networks enables location- and network-independent service provision.***

- **Corporate convergence** occurs when firms from one sector acquire, merge, or collaborate with firms from another sector. Examples include partnership, merger, or expansion of firms in the internet, broadcasting, and telecommunication sector. Mergers expand individual firms, increase prospects for new services or markets, and reduce costs and tariffs. However, mergers may result in market dominance and reduced competition and diversity of media content. ***Corporate convergence or mergers create new business models and alter the market structure, changing the dynamics of the sector.***

In addition to the above, Park (2019) identified another form of convergence:

- **Technological convergence:** This occurs when functions of different technologies are combined and interoperate as a single system. Typically, a converged unit can handle multiple media formats corresponding to each technology that is merged. Technology convergence also involves devices and systems with user-interface. For instance, to access material that is distributed over a network, a user interacts with converged devices like a smart TV. Several technologies, such as a computer, a regular TV, and various additional gadgets that once had a single purpose, have all been merged into one smart TV. In addition to broadcasting TV channels, smart TVs work with users to browse the internet, view photos taken with smartphones and stored in the “cloud,” show feeds from home security cameras connected to a network, play music, alert users to incoming calls and messages, and enable video conferencing. Multiple tasks may be carried out by smart TVs by processing a range of media formats. ***In addition to the issue of regulatory jurisdiction, concerns about digital privacy and data security may be areas where legislative and/or oversight actions will be needed.***

Figure 16. Types of Convergence

Sources: Singh and Raja (2010); Park (2019)

According to the DOST-Advanced Science and Technology Institute (DOST-ASTI)⁵, the country’s leading research institution for scientific research and development in the advanced fields of Information and Communication Technology and Microelectronics, new technological developments are expected to enhance various industries and domains, including the ICT sector (Table 4). At least eight (8) of these trends are covered by the DOST-ASTI flagship programs under the ICT & Electronics R&D Roadmap 2022-2032, namely: (1) Environment for Extreme Computing Performance, Networks, and Data (EXPAND), (2) Emerging Research and Applications (ERA), and (3) Intelligent Systems Initiative for the Philippines (ISIP).

Table 4. New technological developments

Trends	Technologies beneath the trend	Implications	Covered by DOST-ASTI
Next-level process automation and virtualization	Industrial Internet of things (IoT) Robots/collaborative robots (cobots)/robotic process automation (RPA) Digital twins 3-D/4-D printing (additive manufacturing)	Streamline routine tasks, improve operational efficiency, and accelerate time to market	ERA
Future of connectivity	5G and IoT connectivity	Enable faster connectivity across longer distances, with exponentially faster download and latency reduced to nearly nothing	EXPAND
Distributed infrastructure	Cloud and edge computing	Reach data-hungry devices with far-less latency in a greater number of locations that are even more remote and accelerate decision-making with advanced analytics on demand	EXPAND

Source: Mckinsey & Company (2021) and DOST-ASTI (2022)

While these new technologies offer significant benefits, their impact on industries and the economy could be limited due to the presence of restrictive and outdated regulations or the absence of an enabling environment. To remain relevant and effective, the regulatory framework, composed of the institutions and specific regulations, needs to be updated to be able to respond to changing technological and market conditions.

3.2 The evolution of ICT regulation and its impacts

The requirements of telecommunications regulation have evolved over time (ITU and WB 2020). In the 2000s, with the emerging trends towards privatization and liberalization of telecommunications markets, the promotion of fair competition was the main concern, along with related issues such as licensing, interconnection of networks, price regulation, and universal service. A decade later, with the rapid adoption of the Internet and mobile cellular communications globally, the new focus of regulation shifted to spectrum management and value-added services. Today, the greatest regulatory challenges arise from the emergence of a data-driven economy. Although the fundamental aspects of telecommunications and ICT regulation remain important, regulations need to catch up with the advancement of new technologies and applications, such as big data, the Internet of Things, and associated new business models. With digitalization, the regulation of data (who is responsible for data and how it is collected, stored, processed, and shared) is considered the latest challenge for governments. There is no consensus yet on whether ICT and broadcasting regulators have the authority to regulate digital services, digital platforms, and other emerging technologies.

Figure 17 depicts the progression in telecommunication and ICT regulation from Generation 1 (G1) to 4 (G4), starting from the command-and-control regime (usually related to state-owned monopolies) to privatization, liberalization, promoting investment, and meeting socioeconomic goals. Building on WB, InfoDev, and ITU (2011), ITU and WB (2020) developed a new set of metrics suitable for digital regulation. Generation 5 (G5), or the Fifth Generation Collaborative Regulation, is considered complementary to the previous generations, which stresses the growing significance of more flexible and collaborative regulatory frameworks capable of tackling the digital economy's impacts across sectors (ITU 2020a).

Figure 17. Generations of regulations: G1 to G5

Source: ITU, ICT Regulatory Tracker 2018, <https://www.itu.int/net4/itu-d/irt/#/generations-of-regulation>; ITU 2020.

Note: Generations 1 through 4 are measured through the ICT Regulatory Tracker. Generation 5 is measured through the G5 Benchmark.

A comprehensive study by the ITU (2021c) examined the relevance of policy and institutional factors on the performance of the ICT sector, particularly in terms of network deployment. Based on data from 145 countries, consisting of 50 initiatives of policy reforms and institutional characteristics and 13 indicators of ICT sector performance between 2008 and 2019, the study found that the regulatory framework consisting of regulatory mandate, regulatory authority, regulatory regime, and competitive model, is associated with a significant increase in investment (defined as the aggregate capital spending of fixed and mobile operators). Specifically, a 10 percent increase in the overall Tracker score is associated with a 7 percent increase in fixed and mobile investment. The results with respect to the individual components of the Tracker are as follows (ITU 2021c, p. 6-7):

- A 10 percent increase in the regulatory authority pillar score is associated with an increase in investment of almost 8 percent. This means that having a separate ICT regulatory agency with the desired characteristics (in terms of independence, accountability, and enforcement power) contributes to creating a suitable framework that spurs investment.
- A 10 percent increase in the regulatory mandate pillar score is linked to an increase in investment of 11 percent. This suggests the relevance of the scope of attributions attributed to the regulatory agency (in terms of being in charge of Quality of Service (QoS), licensing, interconnection rates and price regulation, radio spectrum, universal service, broadcasting, Internet, IT, and consumer issues).
- A 10 percent increase in the regulatory regime pillar score is associated with an almost 4 percent increase in investment. This pillar refers to the adoption of good practices related to specific regulations in terms of licensing, interconnection, QoS infrastructure sharing, access regulation, and number portability, among others. This points out the relevance of adopting best regulatory practices to accelerate investment.
- A 10 percent increase in the competition framework pillar score is linked to an increase of almost 7 percent in investment. This score measures competitive intensity in local and long-distance, mobile, and broadband services, among others, the criteria for determining dominance or significant market power (SMP), plus the allowance of foreign presence in the ICT sector.

The ITU (2021c) study also showed that the regulatory pillars complement each other. For example, the relevance of the regulatory authority and regulatory mandate to explain investment levels is largely weakened in the absence of sound policies. Similarly, Ortiz et al. (2017), which also used the Tracker scores in analyzing the effect of the regulatory environment on fixed broadband subscriptions, found that the regulatory regime (or specific rules) and the competition framework, while essential, will only work if an effective regulatory authority with the right mandate exists.

4 Review of the Philippine ICT regulatory environment

4.1 Overall regulatory environment

4.1.1 ICT regulatory tracker

Although the generations of regulation developed by the ITU do not necessarily reflect the Philippines' experience,⁶ the ITU Tracker is a useful tool for understanding the gaps in a country's regulatory environment. Ortiz et al. (2017) reviewed the formal regulatory landscape in the Philippine telecommunication/ICT sector based on the methodology of the ITU ICT Regulatory tracker. The authors found that the quality of the Philippine ICT regulatory environment is significantly below what is regarded as international best practice. With 100 points representing the best possible scenario, the Philippines was only midway towards the ideal with a score of 52.50 (G2). More recently, as assessed by the ITU, the Philippines scored 74.5 (G3). See Table 5.

⁶ For example, following the US model, telecommunications service in the Philippines has always been provided mainly by private companies and not by the government or state-owned enterprises.

Table 5. ICT Regulatory Tracker: PHILIPPINES

Cluster	2017 PIDS Study	2020 ITU*
Regulatory Authority (Maximum possible: 20 points)	13	18
Regulatory Mandate (Maximum possible: 22 points)	10.5	17.5
Regulatory Regime (Maximum possible: 30 points)	7	17
Competition Framework (Maximum possible: 28 pts.)	22	22
Total (Maximum possible: 100 pts.)	52.5	74.5

*Note: The ICT Regulatory Tracker is based on self-reported information gathered via official ITU Surveys to Member States Administrations, datasets compiled by international organizations, as well as desktop research based on official government sources and direct outreach to national telecom/ICT regulatory authorities. Official data received from Member States Administrations has been verified to the extent reasonably feasible.

Sources: Ortiz et al. (2017) and ITU (2020b)

The seeming improvement in the scores from 2017 to 2020 is due primarily to differences in the assessments as these were conducted by two different groups, although some changes occurred over the period. For example, the Mobile Number Portability Act (RA 11202) was passed in 2019, which allows consumers to switch to another provider using the same mobile number. See Appendix A for details.

With the recent passage of the Public Service Act amendment (RA 11659) allowing full foreign ownership in telecommunications except for foreign state-owned enterprises, the Competition framework is expected to achieve a full score.

4.1.2 Fifth-generation collaborative regulation (G5)

With respect to G5, which is complementary to the other generations of regulation, the Philippines obtained a score of 68.98 out of 100 in 2021 (Table 6). See Appendix B for details.

Table 6. ITU Collaborative Regulation(G5) Benchmark: Philippines (2021)

Sub-component	Score
National Collaborative Governance	24.7
Digital Development Toolbox	17.13
Digital Economy Policy Agenda	14.74
Policy Design Principles	12.04
Total (Maximum possible: 100 pts.)	68.98

Source: ITU (2021d)

National Collaboration Governance

The NTC is mandated to regulate spectrum and broadcasting. It informally or semi-formally collaborates with the DICT for cybersecurity, postal regulation, and ICT regulation, as well as with the departments of Health and Environment. It also has a formal collaboration with the National Privacy Commission (NPC) for data protection, Bangko Sentral ng Pilipinas (BSP) for finance, the Energy Regulatory Commission (ERC) for energy matters, the Philippine Competition Commission (PCC) for competition, Department of Trade and Industry (DTI) for consumer protection, and National Economic and Development Authority (NEDA) for economic development matters. NTC has no collaboration with the transport regulators.

Digital Development Toolbox

The Philippines has a national digital strategy, yet it lacks mechanisms for implementation or operational objectives. The government is also transitioning into e-government. Existing regulations and policies cover ICT accessibility for persons with disabilities, child online

protection, cybersecurity/cybercrime, public service (i.e., smart cities, e-health, and e-education), and data protection laws. The digital strategies and policy development incorporate SDG goals, support sustainable consumption and production and create strategies for youth employment. The provision of broadband services includes women, while it still needs to extend to persons with disabilities and youth.

However, the country lacks regulations or policies for emergency telecommunications (i.e., National Emergency Telecommunication Plans⁷) and infrastructure sharing, such as official register or mapping out all telecommunications infrastructure in the country and cross-sector infrastructure sharing or fiber co-deployment. Furthermore, regulations or policies are not in place for digital identity framework and e-waste regulations/management standards.

Digital economy policy agenda

The country joined Initiatives in regional integration, which included ICT chapters, and made commitments to facilitate trade in telecommunication services. Policies and regulations exist for innovation, digital market, e-commerce or e-transactions, and competition. Digital strategies include multiple economic sectors, and digital market players are offered incentives. The Philippine digital economy needs forward-looking strategies or policies focusing on spectrum (such as 5G, IMT-2000, and satellite), IoT, spectrum management, cloud computing, and AI. Specific taxes for the digital sector or internet services are yet to be implemented.

Policy Design Principles

Decisions pass through administrative procedures, and affected stakeholders may request reconsideration or appeal. Mechanisms for regulatory experimentation and regulatory sandboxes for digital financial inclusion are also in place. Enacted laws and policies are available on government websites. Public access to information and ethics rules are in place. Public consultations are one of the tools used to gather feedback from stakeholders. However, the mechanisms on how and when they are considered or incorporated remain unclear. National policies and regulations are not entirely technology and service-neutral for authorization or operating licenses or spectrum. There is no regulatory impact assessment before decisions are made. In addition, regulatory agencies neither conduct policy rolling reviews nor ex-post policy rolling reviews.

4.2 Specific structural issues

Various technologies are now available to address the digital divide, including (Chaoub 2021):

- Non-terrestrial networks, which are remote-ready, long-range, and robust technologies, such as satellites (e.g., low earth orbit satellites), unmanned aerial vehicles (UAVs), and high altitude platform stations (HAPSs);
- TV or GSM WS tower: long-range wireless technology which delivers ICT services over less power and penetrates difficult terrains;
- Cost-effective software-defined technology, such as integrated access and backhaul (IAB)-based satellite station) and
- Other connectivity solutions: Free Space Optical (FSO) unit, ground stations, wireless towers and Wi-Fi technology, and PLC or fiber connections

In addition, business models such as Mobile virtual network operator model, Community network model, and hybrid model are possible options for providing internet connectivity in

⁷ <https://www.itu.int/en/ITU-D/Emergency-Telecommunications/Documents/2022/NETP%20baseline%20one-pager.pdf>

the countryside. Some rural areas in the Philippines use signal repeaters, makeshift towers, and directive antennas to improve connectivity. The DOST has developed the Robust and Rapidly Deployable GSM Based Stations and Backhaul for Emergency Response (ROGER) as a backup communication channel during disasters. Other private sectors deployed community cellular networks (CCNs) and mobile telephony in rural areas, similar to other countries⁸.

Although various solutions are now available that could address the digital divide in the country, an enabling regulatory environment is still lacking. Instead, outdated laws have stifled the expansion of digital infrastructure and access to the internet (Mirandilla-Santos 2021). This section focuses on structural issues which have been highlighted in past studies and validated in the KIIs as the key impediments.

4.2.1 The regulator

4.2.1.1 Regulatory mandate

There are three primary institutional design models for regulators overseeing the ICT sector – the sector-specific regulator, the multisector regulator (such as a utilities-based regulatory authority), and the converged regulator. In 2017, more than 70 percent of regulators globally were converged (ITU and WB 2020). International best practices call for creating a consolidated regulator with jurisdiction over ICT and media/broadcasting. The requirement for formal coordination procedures across agencies/authorities is no longer necessary because one authority is in charge of regulating various services, which often makes planning and launching converged technologies and services more effective. As a result, converged regulators help enable market integration in a converged system (ITU 2020b).

As indicated in Box 1, the NTC could be considered a converged regulator as it has responsibility for telecommunications, media/broadcasting as well as spectrum. Its mandate is based on several laws and executive orders.

Box 1. Mandate of the National Telecommunications Commission

- To regulate the installation, operation and maintenance of radio stations both for private and public use (Radio Control Law, Act No. 3846, as Amended).
- To regulate and supervise the provision of public telecommunications services (Radio Control Law, Act No. 3846, as Amended and Public Telecommunications Policy Act of 1995, RA No. 7925).
- To manage the radio spectrum (Radio Control Law, Act No. 3846, as Amended and Public Telecommunications Policy Act of 1995, RA No. 7925)
- To regulate and supervise radio and television broadcast stations, cable television (CATV) and pay television (EO No. 546 and EO No. 205).
- Regulate, supervise and control all radio communications, telecommunications and broadcast, including cable television, facilities and services, and promote consumer welfare and protection.

Source: Lifted in full from NTC (n.d.)

Part of the functions of the NTC, as stated in EO 546 and RA 7925, specifically covers the protection of consumers and industry participants.⁹ The National Broadband Plan (DICT 2017)

⁸ Dr. Franz A. de Leon (Director, DOST-ASTI) in response to Author's questions on June 07, 2022.

⁹ EO 546 Sec. 15. Functions of the Commission -

g. Promulgate such rules and regulations, as public safety and interest may require, to encourage a larger and more effective use of communications, radio, and television broadcasting facilities and to maintain effective competition among private entities in these activities whenever the Commission finds it reasonably feasible;

RA 7925 Article III Administration Sec. 5 Responsibilities of the National Telecommunications Commission -

proposed to amend and revise RA 7925 in order to strengthen the roles of DICT and NTC to promote competition by redefining the market structure; revising the law to accommodate technology advancements, such as the shift from telephone to internet paradigm; and setting specific clauses to protect consumer rights, among others. The amendment should also include the role of PCC in upholding competition in the telecommunications and ICT market.

4.2.1.2 Regulatory authority and independence

There is a perception that the NTC is a powerful agency, given its mandate and the functions assigned to it by various laws. However, it is regulatory independence or lack thereof that better reflects its authority.

The establishment of an independent regulator is one of the key determinants of private investment in digital development. Together with privatization and competition, they provide investors with confidence in the quality of the regulatory environment of a country. The existence of an independent regulatory agency, in particular, signals impartiality in decision-making and regulatory certainty regardless of changes in government (UNCTAD 2017). An effective regulatory authority with the proper mandate is necessary to enforce the regulatory regime (or specific rules) and competition framework (Ortiz et al. 2017). Countries need to have a strong regulatory institution and improve their capacity to implement and enhance rules (Montenegro & Araral, 2020).

The independent regulator is the gold standard in regulation, especially for infrastructure services such as telecommunications, where credibility and stability are of paramount importance. Regulators need to be sufficiently insulated from short-term political pressure and regulatory capture by industry.

According to Brown et al. (2006, p.50), the key characteristic of the independent regulator model is decision-making independence, which means that its decisions are made without the prior approval of any other government entity, and only a court or a pre-established appellate panel can overrule the regulator's decisions. Furthermore, the institutional building blocks for decision-making independence consist of (1) organizational independence (organizationally separate from existing ministries and departments); (2) financial independence (an earmarked, secure, and adequate source of funding), and (3) management independence (autonomy over internal administration and protection from dismissal without due cause).

Below are key characteristics of the NTC when benchmarked against the independent regulator standard (Ortiz et al. 2017; Barcenas and Serafica 2018).

A regulatory agency should be created by law as such legal standing enhances its independence by precluding any legal interference. Moreover, decision-making should be done by a board of commissioners (vs. a single regulator).

The National Telecommunications Commission was created by Executive Order No. 546 s.1979 on "Creating a Ministry of Public Works and a Ministry of Transportation and Communications" (See Box 2). The NTC is currently headed by a Commissioner and two

b) Ensure quality, safety, reliability, security, compatibility, and interoperability of telecommunications facilities and services in conformity with standards and specifications set by international radio and telecommunications organizations to which the Philippines is a signatory;

d) Foster fair and efficient market conduct through, but not limited to, the protection of telecommunications entities from unfair trade practices of other carriers;

e) Promote consumers welfare by facilitating access to telecommunications services whose infrastructure and network must be geared towards the needs of individual and business users;

f) Protect consumers against misuse of telecommunications entity's monopoly or quasi-monopolistic powers by but not limited to the investigation of complaints and exacting compliance with service standards from such entity.

Deputies following Sec. 16. Although there is only one Commissioner, in 1997, the Supreme Court ruled that NTC is a collegial body and that decision-making is not vested in the Commissioner alone.

The President can overrule NTC's decisions, and as an attached agency to the DICT, the DICT can question NTC's policies and programs. Also, the NTC officials are not shielded from litigation in the exercise of their functions. NTC is not required to conduct public consultations except for quasi-judicial issues (Ortiz et al. 2017; Barcenas and Serafica 2018).

The EO provides some guidance on the professional qualifications or technical backgrounds of the Commissioners, but it is not required.

Box 2. Creation of the National Telecommunications Commission

EO 546 s.1979

Sec. 14. National Telecommunications Commission. The Board of Communications created under Article III, Chapter I, Part X of the Integrated Reorganization Plan, as amended, and the Telecommunications Control Bureau created under Article IX, Chapter I, Part X of the same Plan, as amended, are integrated into a single entity to be known as the National Telecommunications Commission and hereinafter referred to as the Commission.

Sec. 16. Organization of the Commission. The Commission shall be composed of a Commissioner and two Deputy Commissioners, preferably one of whom shall be a lawyer and another an economist. The Commissioner and Deputy Commissioners shall be of unquestioned integrity, proven competence, and recognized as experts in their fields, related, as much as possible, to communications.

The Commission shall determine its organization structure and personnel subject to the approval of the Ministry and other authorities concerned.

The Commission shall be under the supervision and control of the Ministry, except that with respect to its quasi-judicial functions, its decisions shall be appealable in the same manner as the decisions of the Board of Communications had been appealed. The Commission may have regional offices in places and of such number as may be authorized under Article I, Chapter III, Part II of the Integrated Reorganization Plan, as amended.

Source: Executive Order 546 (s. 1979)

Commissioners or directors of regulatory agencies should be appointed to fixed terms of office, and their tenure should not be concurrent with the term of office of government officials and legislators.

Unlike other regulators such as the National Privacy Commission, the Energy Regulatory Commission, or the Philippine Competition Commission, NTC officials do not have a fixed term of office.

The regulatory agency must have the power to establish the administrative structure of the agency and make all relevant personnel decisions.

In the case of the NTC, the creation or reclassification of all positions requires the approval of the Department of Budget and Management.

The regulatory agency must have a stable and reliable source of revenue for its operations. Moreover, it should be able to offer competitive compensation packages and career opportunities, including training and education.

Multiple funding sources generally provide the regulator with more financial independence and autonomy in decision-making (ITU 2020b).

The NTC only relies on annual appropriations from Congress. Fees collected are remitted to the National Treasury in line with the One Fund concept. The annual budget of the NTC is less than 10 percent of its revenues.

Unlike other regulators such as the BSP, PCC, and the SEC, the NTC is not exempt from the Salary Standardization Law.

As shown in Figure 18, the NTC receives the highest proportion of revenue from spectrum user fees (SUF) with an increasing trend from 2017 to 2020, collecting about PHP 5 Billion in 2020. Supervision and regulation fees also provide earnings of about PHP 1.3 to 1.5 Billion from 2014 to 2020. Revenues from registration, licensing, and inspection fees in 2020 collected an estimated PHP 232 to 328 Million each. Other revenue sources are Permit Fees, Fines and Penalties-Service Income, Filling Fee, Application Fees, Other Service Income, Clearance and Certification Fees, Examination fees, and Verification and authentication fees. In 2020, the NTC collected total revenue of PHP 7.7 Billion (PHP 3 Billion more than PHP 4.7 Billion in 2014).

4.2.2 Licensing and authorization regime

4.2.2.1 Entry and establishment

Following international best practices, the regulator should have the sole authority for licensing. An unbiased and independent regulatory authority will have the competence to assess technical and financial qualifications. Additionally, being the lone authority, it can also more readily respond to market needs and determine entry conditions. In the APEC region, the Philippines is the only country that requires legislative approval before applying certificate to operate from the regulator (Ortiz et al. 2017). Although Congress can delegate to an administrative agency such as the NTC any franchise or certificate necessary for the operation of public service, RA 7925 (1995) specifically requires a legislative franchise to enter the Philippine market. A Certificate of Public Convenience and Necessity (CPCN) must also be obtained from the NTC.

The requirement to obtain a franchise applies to the six types of telecommunications entities listed in RA 7925, namely: local exchange operator, inter-exchange carrier, international carrier, VAS, mobile radio services, and radio paging services. However, for value-added service providers, a franchise is not a requirement if it does not put up its own network. RA 3846, as amended (An Act Providing for the Regulation Radio Stations and Radio Communications in the Philippine Islands and for other purposes August 10, 1963), also requires a legislative franchise to construct, install, establish, or operate a radio station. DICT (2017) has proposed to delineate the ICT sector into three categories, considering the industry's

fast-changing landscape: (1) content or applications provider, (2) network provider, and (3) service provider. It also recommends amending the Radio Control Law (RA 3846) to provide guidelines for emerging players such as mobile virtual network operators. The requirements should be reduced, and the procedures simplified for the entry of market players who want to build and operate internet-based networks.

Barcenas and Serafica (2018) observed that securing a legislative franchise takes significant time and resources as the process is similar to the passage of any ordinary law. As described (p. 30), the passage of a law granting a legislative franchise could take approximately two (2) years and may extend to five (5) years if not approved within a given term, as members of Congress are elected every three (3) years. By the time approvals have been obtained from Congress and the NTC for the franchise and CPCN, respectively, technology and market conditions may have already changed substantially.

Securing a legislative franchise is not aligned with international best practices as it duplicates the function of the regulator. Removing the requirement could be a challenge, however, not only in terms of the willingness of Congress to give up this authority but also from the perspective of existing franchise holders. For example, it was noted in one interview conducted for this study that enfranchised entities such as telcos enjoy tax breaks for the purchase of equipment while ISPs who are VAS operators that do not have a legislative franchise are not accorded the same privilege (presumably because they are not building a network). There may be other perks enjoyed by franchise holders, which are extended indefinitely or as long as the legislative franchise system exists. RA 7925 SEC. 23. on the Equality of Treatment in the Telecommunications Industry states that “Any advantage, favor, privilege, exemption, or immunity granted under existing franchises, or may hereafter be granted, shall ipso facto become part of previously granted telecommunications franchises and shall be accorded immediately and unconditionally to the grantees of such franchises: Provided, however, That the foregoing shall neither apply to nor affect provisions of telecommunications franchises concerning territory covered by the franchise, the life span of the franchise, or the type of service authorized by the franchise.” Equality of treatment is reflected in the respective laws granting the franchise.

More recently, Executive Order No. 127 S. 2021 (Expanding the Provision of Internet Services through Inclusive Access to Satellite Services, Amending Executive Order No. 467 (S. 1998)) was signed, which allows enfranchised telecommunications entities as well as Internet Service Providers (ISPs) and value-added service (VAS) providers registered with the NTC to directly access to all satellite systems for fixed or mobile and international or domestic access. Broadcast service providers may also be permitted direct access to international fixed satellite systems subject to NTC rules, regulations, and authorizations. The satellite system providers should be accredited by the DICT.

The Public Service Act amendment (RA 11659), which was signed into law in March 2022, removed foreign equity restrictions in the ownership of telecommunications and other industries which are considered public services but not public utilities. Safeguards were put in place (e.g., in the case of foreign state-owned enterprises) in the interest of national security. Previously, the 40 percent maximum foreign ownership limit was a major barrier to entry in the sector.

The NTC issues service-specific and multi-service individual licenses (Ortiz et al. 2017). However, issuing service-specific licenses is a lengthy process since it only applies to a particular type of service over a specific kind of network. Multi-service individual licenses are considered better than service-specific licenses to facilitate service innovations. However, unified or global licenses are preferred best to increase market liberalization; keep up with the

growth and innovation of the ICT sector; and equalize all service providers, promoting competition. It should be noted that issuing individual licenses for the radio spectrum authorizations is still a common practice around the world, especially when the demand for a specific frequency band exceeds availability (ITU 2020b).

As discussed earlier, Next Generation Networks (NGN) and convergence have removed the traditional market barriers and increased the value of neutrality and flexibility in authorization regimes. Traditional authorization processes and techniques need to be carefully reconsidered as the parameters of the ICT sector evolve. Network operators and access providers seek regulatory certainty as they invest in building new infrastructure and upgrading equipment. With this, regulators need to ensure the regulatory framework is flexible to allow technological innovations for the ICT industry to provide efficient and new services (WB, InfoDev, and ITU, 2011)

4.2.2.2 On-going operations

ICT operators are subjected to various requirements and permits from the regulator and other agencies, including local government units. As shown in the previous section, the NTC imposes various fees on ICT operators. The acquisition of the right-of-way and other permits from LGUs is also one of the constraints to establishing telecommunications networks (Barcenas and Serafica 2018).

World Bank (2020a, p.42) notes that some bureaucratic procedures, such as arbitrary fees and permits, might be viewed as “institutionalized barriers to competition” since they inhibit timely and cost-effective infrastructure expansion in the last mile. Service providers are required to comply with an estimated average of 25 permits, depending on the location of the cell site and other requirements imposed by the authorizing institution. Streamlining processes in obtaining permits and licenses among pertinent organizations, LGUs, and associations and simplifying administrative registration and qualification procedure for the assignment of radio spectrum and entry broadband network providers should be considered.

To enable faster roll-out, LGUs are encouraged to streamline permits and processes by establishing one-stop shop offline and online facilities. Likewise, the national government may also consider the review of existing permits and licenses perceived as unnecessary and redundant requirements (DICT 2017).

4.2.2.3 Other issues

Quasi-judicial vs. administrative process

Based on the KIIs, the quasi-judicial nature of decision-making by the NTC also act as a significant barrier to entry and operations of telecommunications entities. For example, before you can be authorized to build the network, it goes through a quasi-judicial process, which could take from 6 months to a couple of years. This slows down the ability of the industry to respond to market changes.

Impact on R&D and innovation

DOST-ASTI, which conducts R&D in ICT and Electronics, is bound by the same policies and regulations as any public or private entity that are more service-oriented, operations-focused, and profit-oriented. For example, in granting spectrum assignments or radio frequency permits and licenses, there is no special consideration for activities that fall under R&D. The Institute applies for such permits and licenses, it is subjected to the same evaluation criteria as other non-R&D companies, which lead to delay or denial of permits crucial to carrying out R&D.

4.2.3 Spectrum management

Radio spectrum is used to transmit information wirelessly for many vital services such as television and radio broadcasts, mobile phones and Wi-Fi, as well as baby monitors, GPS, and radar.¹⁰ As the world becomes more reliant on this expanding range of services, the demand for the limited supply of usable radio waves is quickly increasing. Radio spectrum easily lacks supply due to the public's need for more information, faster connectivity, and higher-definition media. In addition, there is a greater chance of service interference since radio spectrum is used more often. Governments employ spectrum management to (GSMA 2017a, p.8):

- Ensure there is sufficient spectrum for the services which need it the most and provide the greatest socio-economic benefits;
- Encourage spectrum efficiency so the scarce resource can be maximized;
- Minimize interference nationally and internationally.

National governments largely influence the quality and accessibility of wireless services, which include high-speed mobile broadband with broad coverage, high-definition television and radio broadcasts, navigation systems (e.g., GPS and Galileo), and efficient air traffic control, among others. At an international level, governments from different countries come together to decide on allocating spectrum to particular services. This minimizes global and local interference, reduces equipment costs, and enables roaming onto foreign networks. National governments then employ different types of licenses to use these frequency bands for particular service providers. A fair and transparent licensing regime attracts investments in ICT services, benefitting consumers and businesses (GSMA 2017a).

Because the radio spectrum is a national resource, each country's government has the authority and responsibility over its use. Despite having the authority, the DICT has yet to establish a spectrum management policy for the NTC to adopt (Galla 2018). Currently, spectrum management is a function carried out by the NTC, which grants permits for the use of radio frequencies for wireless telephone and telegraph systems and radio communication systems, including amateur radio stations and radio and television broadcasting systems (EO 546 s. 1979, Sec. 15c). Under RA 7925 Sec 15, the NTC can collect a reasonable fee for the use of the spectrum. Currently, spectrum fees are based on three factors, (1) bandwidth, the wider the bandwidth, the more expensive; (2) where it will be used, the fees are lower if used in rural areas; and (3) the demand for spectrum, the lower the demand, the lower the fees. Where demand for specific frequencies exceeds availability, the Commission is mandated to hold open tenders to ensure wider access. The radio frequency spectrum allocation and assignment are also subject to periodic review.

Until now, all frequencies have been assigned through a simple administrative procedure comparable to a "beauty pageant," which is likely to benefit incumbents and major telecommunications companies and leaves little chance for spectrum to be allocated to a new entrant. Additionally, "inefficiencies and underutilization of spectrum bandwidth, not to mention limiting the flexibility in service provision and impeding technological developments" due to the administrative approach to frequency assignment (World Bank 2020a, p.45). While

¹⁰ A **spectrum** is a range of different electromagnetic waves which vary according to frequency and includes radiowaves, X-rays, infrared waves, and visible light rays, among others. In the mobile industry, it tends to refer to the portion occupied by radio waves that extend from those at low frequencies such as 10 kHz up to high frequencies such as 100 GHz (GSMA 2017b p. 37) A **radio spectrum** is a portion of the electromagnetic spectrum below 300 GHz, which, by virtue of its natural characteristics, is suitable for the propagation of radio waves. The radio spectrum is divided into a number of designated blocks, called bands, which are assigned to various user categories for specific purposes (e.g., mobile services or TV broadcasting) and may be assigned by a national regulator to a particular user (GSMA 2017b, p. 34).

spectrum is assigned through an administrative process, it is recalled through a quasi-judicial process. For example, a telco can request for spectrum, and the NTC can give an additional five (5) megahertz in the 900-megahertz band, and no letter is needed. However, if the state wants to recall it, the NTC will need to conduct hearings.

Following good regulatory practice, all applications, approvals, and decisions for test permits, demonstration permits, assignment, re-assignment, or co-use of the spectrum should be published. Additionally, the NTC should conduct public consultations before issuing any approvals. The policy should specify the procedures NTC shall follow in recalling and reassigning spectrum to ensure enough spectrum for various operators. Setting the timeframe for a spectrum assignment review and disclosing the outcomes of such a review improves transparency. The NTC and DICT can explore using innovative spectrum management practices, including dynamic spectrum allocation (World Bank 2020a).

Similarly, Senate Committee Report No. 78 (2017) suggested boosting competition by implementing a more transparent system for spectrum assignment, re-farming, and allocation, as well as creating, promoting, and implementing a competitive selection process for allocating publicly-owned spectrum. The system must be updated in a way that best meets the needs of the general public and encourages greater market competition. As stated in the National Broadband Plan (DICT 2017), the government must explore the following strategies to ensure that the existing spectrum can supply and support current and future applications: (1) Repurposing or Recall of Assigned but Unutilized and Underutilized Spectrum, (2) Encourage Co-use of Spectrum, and (3) Implement dynamic spectrum allocation.

It has also been noted that in other countries, priority in the use of spectrum is given to the military, law enforcement, and emergency services, but there is no such policy in the Philippines. Support for R&D activities in the ICT sector, especially those conducted by the public sector, is also not prioritized. DOST-ASTI, which conducts R&D in ICT and Electronics, is bound by the same policies and regulations as any public or private entity that are more service-oriented, operations-focused, and profit-oriented. In granting spectrum assignments or radio frequency permits and licenses, there is no special consideration for activities that fall under R&D.

Research entities, with approved funding from the Philippine Government, act as a quasi-Public Telecommunications Entity (PTE), performing functions associated with PTEs. However, such groups experience difficulty in importing and deploying radio equipment, as these activities are limited to PTEs. This situation severely hampers the implementation of the research projects. As a recourse, government-implemented projects have sought assistance from frequency assignees for concurrence to co-use their assigned frequencies in areas where they have no network presence and deployments. (See Box 3 for examples).

Box 3. R&D activities of the government

Case 1: Project ROGER used GSM frequencies assigned to EXTELCOM Project ROGER, or Robust and Rapidly Deployable GSM Base Station and Backhaul for Emergency Response, requested EXTELCOM to allow the project to use their GSM Frequencies in areas where they have no network presence. EXTELCOM agreed and ROGER was granted an NTC Demo Permit on a strictly non-interference basis.

Case 2: The Village Base Station Project used GSM frequencies assigned to Globe Telecom. The University of the Philippines (UP), representing The Village Base Station Project, signed a Memorandum of Agreement with Globe Telecom, through its Corporate Social Responsibility Program, to “provide financial and infrastructure support, such as: SIM cards, network-in-a-box equipment, radio frequencies, and other forms of assistance for the completion of the one-year pilot study.”

These workarounds present a significant delay in the implementation of projects. National Government Agencies (NGAs) performing R&D to provide access in unserved and underserved areas should (1) be given the authority to import radio communication equipment operating at assigned bands for mobile broadband internet access; (2) be granted the use of the said bands on a secondary and non-interference basis, specifically for use in unserved and underserved areas; and (3) be considered as PTEs only for the purposes of implementation of relevant policies such as the revised Telco JMC of 2021.

Source: Dr. Franz A. de Leon (Director, DOST-ASTI) in response to Author’s questions on June 07, 2022

The NTC is also tasked to “Sub-allocate series of frequencies of bands allocated by the International Telecommunications Union to the specific services” (EO 546 s. 1979, Sec. 15d). It has been suggested, however, that following the spectrum allocation set by the ITU could be quite limiting. As an archipelago, radio frequency interference with other countries is not a problem for the Philippines. It was noted that the standards for WiFi, Bluetooth, and 5G were developed by other organizations.

5 Conclusion and recommendations

Across different metrics, the internet performance of the Philippines remains subpar compared to ASEAN as well as other countries at the same level of development. The Philippines falls short of the affordability target for broadband services of less than 2 percent of monthly GNI per capita by 2025 set by the UN Broadband Commission. In 2021, the price of data-only mobile broadband in the Philippines was at 2.04 percent of GNI per capita, making it the most affordable broadband service, while fixed broadband was the most expensive at 11.56 percent. Moreover, in 2019, only 17.7 percent of Philippine households were connected to the internet. This means that roughly four in every five households in the country are excluded from participating in the digital economy. Furthermore, internet access across regions is also disproportionate. Households in NCR are seven times more likely to have internet access than those in the BARMM. Bold measures are needed to achieve accelerated and inclusive digital connectivity.

An effective regulatory framework, composed of regulatory authority, regulatory mandate, regulatory regime, and competition model, is linked to a positive and significant improvement in ICT performance. The quality of the ICT regulatory environment in the Philippines falls short of global standards, especially in light of the changes in technology. This paper reviewed the overall regulatory environment and identified specific structural issues relating to the regulator, the licensing regime, and the radio spectrum management. These issues are

interrelated and complement each other. For example, regulatory independence cannot be fully achieved unless it is given the sole authority to grant licenses to operate and use radio spectrum. In turn, management of the radio spectrum must be based on a national policy that promotes the greatest socio-economic benefits. According to ITU-R (2018), a legal framework for spectrum management should be developed as a prerequisite for licenses or authorization since it is a scarce resource and can be influenced by market pressure.

The policy recommendations discussed in this paper are not new. Various studies, as well as the government's own development and sectoral plans, have already identified the same issues and policy prescriptions, including the specific laws to be amended or repealed, namely: the Public Telecommunications Policy Act (RA 7925) and the Radio Control Law (RA 3846). A separate charter for the regulator may also be needed. These laws were either adopted or last amended before the advent of broadband. Amending or creating laws should aim to speed up the adoption of various technological developments, especially in the rural areas; attract more investment; and enhance the quality service in ICT to bridge the gap in digital inequality. In order to move forward with these reforms, various steps could be undertaken.

On reinventing the NTC

The independent regulator model is the gold standard in the regulation of infrastructure services such as telecommunications. The agency responsible for regulating ICT, which is the foundation of the digital economy, must be strengthened to effectively carry out its role. To replace EO 546 s.1979, which created the NTC, a new charter may be needed to consolidate the mandate of the NTC based on various laws, clarify the scope of its quasi-judicial and administrative functions and processes, and define its relationship with other agencies (for example, the Philippine Competition Commission), among other things.

Most importantly, the principles of regulatory independence and key attributes of an independent regulator must be embedded in the “new” NTC. The charters of ICT regulators in other countries as well as cross-sectoral (transversal) and sector-specific regulators in the Philippines could be examined. Insights and lessons could also be drawn from the experience of previous institutional reforms, particularly the creation of an independent central bank (See Stern and Trillas 2003 for similarities). The New Central Bank Act (RA 7653) contains specific provisions to ensure regulatory independence (in terms of institutional; personal; functional and operational; financial and organizational independence) while also incorporating good governance principles of transparency and accountability (Bagsic and Glindro 2006; SEPO 2011).

On reforming the licensing regime

The licensing regime is restrictive and burdensome, resulting in costs and delays in network buildup and the deployment of new technology. The types of licenses issued should be reviewed to further liberalize market entry. A main barrier to entry is the legislative franchise requirement. Moreover, obtaining and renewing a franchise, which is inherently a political process, contributes to uncertainty and increases the risks of investing in the digital infrastructure in the Philippines.

An in-depth cost-benefit analysis of the legislative franchise system could help convince policymakers to adopt international best practices in licensing where authority is given solely to the regulator. Additionally, a comprehensive assessment of the “advantage, favor, privilege, exemption, or immunity granted under existing franchises” (RA 7925, art. VIII, sec. 23) should also be conducted in order to develop a transition plan, if needed, and ensure that current franchise holders will not be worse-off under a simpler system.

On formulating the national spectrum policy

When 3G was the state of the art in wireless technology, Llanto (2006) advocated reexamining the country's spectrum management policy. The review should involve, among others, the allocation and assignment of current radio spectrum bands, a determination of the optimal allocation and assignment method, and a reallocation of the spectrum to its most efficient allocation and assignment (p.8).

Sixteen years later, with 5G already commercially available and 6G on the horizon, a national spectrum policy has yet to be formulated for the NTC to implement. In consultation with multiple stakeholders, the DICT should develop the policy and framework to ensure that the spectrum is used efficiently and benefits everyone. A spectrum plan or roadmap should also be developed by the DICT together with other agencies, such as the DOST and DTI, to ensure alignment with relevant technology and industry roadmaps, forecast demand, encourage long-term investment, and ensure that spectrum use contributes to achieving national socio-economic goals.

7 Appendix A. ITU ICT Regulatory Tracker: The Philippines

7.1 Regulatory Authority

Indicator	<i>PIDS Study 2017</i>	<i>ITU 2020</i>
Separate telecom/ICT regulator	A separate regulator exists - the National Telecommunications Commission. However, it has no fiscal autonomy and the Commissioners have no security of tenure.	Yes
Autonomy in decision making	Yes	Yes, for some decisions
Accountability	Reporting Requirements: Annual report to the sector Ministry (DICT) Budget: DBM recommends while it is Congress that approves. Appointment of head and members: The President appoints.	Two different entities approve regulator's budget, appoint the Members/Head, and require reporting
Percentage of diversified funding	Government appropriation (100%)	Minimal influence
Public consultations mandatory before decisions	Yes, for its quasi-legislative powers	Yes
Enforcement power	NTC has sufficient enforcement power based on enabling laws (RA 7925, Act 3846, CA 146, EO 546, EO 125), and the rules and regulations it promulgates.	Yes
Sanctions or penalties imposed by regulator	Administrative fines and penalties, and license revocation.	Strong sanction
Dispute resolution mechanism	Yes	Yes
Appeals to decisions	Yes	Yes
Existence of Competition authority	Yes. The Philippine Competition Commission was established in 2015.	Yes
Total for cluster 1 (Maximum possible: 20)	13	18

Sources: Ortiz, et al. (2017) and ITU (2020b)

7.2 Regulatory Mandate

Indicator	<i>PIDS Study 2017</i>	<i>ITU 2020</i>
Traditional mandate: entity in charge of quality of service obligations measures and service quality monitoring	Enforcement of quality of service obligations measures - NTC Service quality monitoring - NTC	Regulatory Authority/Authorities
Traditional mandate: entity in charge of licensing	Congress (Franchise) and NTC (CPCN)	Regulatory Authority/Authorities
Traditional mandate: entity in charge of interconnection rates and price regulation	Interconnection rates - None. It is negotiated by the parties. Price regulation - NTC	Government & Regulatory Authority
Spectrum: Entity in charge of radio frequency allocation and assignment	NTC	Regulatory Authority/Authorities
Entity in charge of Spectrum Monitoring and Enforcement	NTC	Regulatory Authority/Authorities
Entity in charge of universal access/service	Operators	Regulatory Authority/Authorities
New mandate: entity in charge of broadcasting (radio and TV transmission)	NTC	Regulatory Authority/Authorities
New mandate: entity in charge of broadcasting content	Self-regulation (KBP).	Government & Regulatory Authority
New mandate: entity in charge of Internet content	Not regulated.	Government & Regulatory Authority
New mandate: entity in charge of IT	Not regulated.	Government & Regulatory Authority
Consumer issues: entity responsible for comparative tariff information, consumer education and handling consumer complaints	Providing comparative tariff information – None Informing consumers of their rights (consumer education) - DTI Handling consumer complaints - NTC (for regulated services) and DTI	Regulatory Authority/Authorities
Total for cluster 2 (Maximum possible: 22)	10.5	17.5

Sources: Ortiz, et al. (2017) and ITU (2020b)

7.3 Regulatory Regime

Indicator	<i>PIDS Study 2017</i>	<i>ITU 2020</i>
Types of licenses provided	Service-specific individual licenses - Yes Multi-service individual licenses - YES Unified/global licenses - No General authorizations - No Registration- Yes for Value Added Services and license -exempt equipment	Unified/global licences, General authorizations or Simple notification
License exempt		License exempt regime exists
Operators required to publish Reference Interconnection Offer	No	No
Interconnection prices made public	No	Yes
Quality of service monitoring required	No	Yes
Infrastructure sharing for mobile operators permitted	Yes	Yes
Infrastructure sharing mandated	No. It is considered by NTC as a business decision of the operators.	No
Co-location/site sharing mandated	It is encouraged by NTC.	No
Unbundled access to the local loop required	No	No
Secondary trading allowed	No	No
Band migration allowed	No	Yes
Number portability available to consumers and required from fixed-line operators	No	No
Number portability available to consumers and required from mobile operators	No	Required by law but currently unavailable to consumers
Individual users allowed to use VoIP	Yes	Yes
National plan that involves broadband	Yes through DICT.	Yes
Total for cluster 3 (Maximum possible: 30)	7	17

Sources: Ortiz, et al. (2017) and ITU (2020b)

7.4 Competition Framework

Indicator	<i>PIDS Study 2017</i>	<i>ITU 2020</i>
Level of competition in local and long distance (domestic and international) fixed line services	Local fixed line services - Full competition Domestic fixed line services - Full competition International fixed line services - Full competition	Full competition
Level of competition in IMT (3G, 4G, etc.) services	Full competition	Full competition

8 Appendix B. ITU Collaborative Regulation(G5) Benchmark: Philippines (2021)

National collaborative governance	24.07
Collaboration with (Independent) Spectrum Authority	Yes, formal collaboration (MOU or joint program or committee) or ICT regulator has the mandate / same authority
Collaboration with (Independent) Broadcasting (content) Authority	Yes, formal collaboration (MOU or joint program or committee) or ICT regulator has the mandate / same authority
Collaboration with Cyber security agency	Yes, formal collaboration (MOU or joint program or committee) or ICT regulator has the mandate / same authority
Collaboration with CERT	Yes, formal collaboration (MOU or joint program or committee) or ICT regulator has the mandate / same authority
Collaboration with (Independent) Data Protection Authority	Yes, formal collaboration (MOU or joint program or committee)
Collaboration with ICT ministry OR ICT regulator AND Information Society Agency	Yes, informal or semi-formal collaboration or Activities carried out under the same ministry
Collaboration with (Independent) Finance Regulator	Yes, formal collaboration (MOU or joint program or committee)
Collaboration with Energy regulatory Authority	Yes, formal collaboration (MOU or joint program or committee) or ICT regulator has the mandate / same authority
Collaboration with Transport regulatory Authority	No collaboration, no entity in charge, or no data
Collaboration with (Independent) Competition Authorities	Yes, formal collaboration (MOU or joint program or committee)
Collaboration with Postal regulation Authority	Yes, informal or semi-formal collaboration or Activities carried out under the same ministry
Collaboration with (Independent) Consumer Protection Authority	Yes, formal collaboration (MOU or joint program or committee)
Collaboration with Ministry of Health (e-health)	Yes, informal or semi-formal collaboration or ICT regulator has the mandate / same authority or Activities carried out under the same ministry
Collaboration with Ministry of Education (e-education)	Yes, formal collaboration (MOU or joint program or committee) or ICT regulator has the mandate / same authority
Collaboration with Ministry of Environment (e-waste)	Yes, informal or semi-formal collaboration or Activities carried out under the same ministry

Collaboration with Ministry of Economic development OR similar focusing on a single or a subset of economic sector/s, e.g., Industry, Agriculture, Fishery)	Yes, formal collaboration (MOU or joint program or committee) or ICT regulator has the mandate / same authority
Digital Development Toolbox	17.13
Is there an overarching digital strategy in place?	Yes
The digital strategy has mechanisms for implementation/ operational objectives?	No/ No strategy
Is broadband considered as part of UAS definition?	No
Is there a digital identity framework in place?	No
Is there an e-gov/ Digital first government National e-government strategy or equivalent?	High development
Has your country adopted e-waste regulations or e-waste management standards?	No
Does a regulatory framework exist for ICT accessibility for persons with disabilities?	Yes
Is there a legislation/regulation for child online protection?	Yes
Has your country adopted any policy/legislation/regulation related to Smart Cities?	Yes
Has your country adopted any policy/legislation/regulation related to e-Health or Smart Health?	Yes
Is there cybersecurity/cybercrime legislation or regulation?	Yes
Has your country signed or ratified the Budapest convention on cybersecurity?	Yes
Are there formal data protection rules (e.g., law, regulations)?	There is a law and a data protection agency has been established
Has your country signed on international agreements determining jurisdiction and/or managing cross border flows on data privacy?	Yes, either determining jurisdiction or managing cross border flows
Has your country signed or ratified the Tampere convention for communications in emergency situations?	No
Does a National Emergency (Telecommunications) Plan exist?	Yes

Does an official register or a mapping exist in your country of all telecommunication/ICT infrastructure?	No
Are there any cross-sector (ICT and other) infrastructure sharing or fibre co-deployment regulations/ agreements/promotion initiatives in your country?	No
Is the digital strategy SDG-oriented OR has mention of SDGs or other international development goals (e.g., MDGs, WSIS goals, EU Strategic objectives)?	Yes
Are there policy instruments aimed at supporting the shift to sustainable consumption and production, or coordination mechanism for sustainable consumption and production?	Yes
Is there a developed and operationalized global strategy for youth employment and to implement the Global Jobs Pact of the ILO?	Yes
Broadband plan / initiative includes to promote the provision of broadband services to women and girls	Yes
Broadband plan / initiative includes to promote the provision of broadband services to persons with disabilities?	No
Broadband plan / initiative includes to promote the provision of broadband services to youth people	No
Digital Economy Policy Agenda	15.74
Does your country belongs to regional integration initiatives with ICT chapters?	Yes
Has your country have made commitment to facilitate trade in telecommunications services?	Yes
Is there a holistic innovation policy or one tailored to the ICT/digital sector?	Yes
Is there a forward-looking competition policy, law or regulation applied to digital markets?	Yes
Has your country adopted a forward-looking or innovative national strategy, policy or initiative focusing on spectrum (e.g., IMT-2000, 5G, FWA, satellite, HAPS, 6 GHz)?	No

Are there policies and regulations for e-commerce/e-transactions?	Yes
Has the Fund financed projects for connecting schools (primary, secondary, post-secondary, universities, specialized training, institutions, etc.) or Multi-purpose telecenters?	No
Does the digital strategy include the educational sector?	No
Does the digital strategy include multiple sectors of the economy?	Yes
Does it includes a strategy, policy or initiative focusing on IoT? Or applied any measure regarding spectrum management and availability for IoT?	No
Has your country adopted any policy/legislation/regulation related to cloud computing?	No
Has your country adopted a national strategy, policy or initiative focusing on AI?	No
Are there specific taxes on the telecom/digital sector OR on Internet services?	No
Are there regulatory incentives targeted at network operators or other digital market players?	Yes, for all
Do codes of conduct exist (voluntary or enforceable/required by regulator)?	Yes
Policy Design Principles	12.04
Are public consultations designed as a tool to gather feedback from national stakeholders and guide regulatory decision-making?	Yes, but there is no requirement/it is unclear what the timeline and process is and whether the regulator incorporates results in their decision-making/ there is no obligation to consider/respond to all comments
Is there a formal requirement for Regulatory Impact Assessment (RIA) before regulatory decisions are made?	No
Are the decisions of the regulatory authority (entity in charge of regulation) subject to a general administrative procedures law?	Yes
Can affected parties request reconsideration or appeal adopted regulations to the relevant administrative agency (all sectors)?	Yes, administrative review by the regulatory body

Are national policy and regulatory frameworks technology and service-neutral ?	Yes, for authorization/operating licences or spectrum, but not for both / There are exceptions to which bands of the spectrum are technology neutral
Are there mechanisms for regulatory experimentation?	Yes
Are there regulatory sandboxes for digital financial inclusion?	Yes
Do ministries/regulatory agencies conduct ex-post policy reviews?	No
Do ministries/regulatory agencies conduct policy rolling reviews?	No
Are the laws (all sectors) that are currently in effect available on a single website managed by the government?	Yes
Is public access to information ensured and fundamental freedoms protected, in accordance with national legislation and international agreements?	Yes
Are there ethics rules in place that apply to the regulator's staff, including Head/Chairperson and Members/Commissioners (e.g., improper acceptance of gifts, personal and financial conflicts of interest, post-employment obligations, etc.)?	Yes
Overall Score	68.98
